BIOLOGY (BIOL)

BIOL 101a or b, Biochemistry and Biophysics  Amaleah Hartman and Lilian Kabeche
The study of life at the molecular level. Topics include the three-dimensional structures and function of large biological molecules, the human genome, and the design of antiviral drugs to treat HIV/AIDS. The first of four modules in a yearlong foundational biology sequence; meets for the first half of the term.  SC ½ Course cr

BIOL 102a or b, Principles of Cell Biology  Amaleah Hartman and Mark Mooseker
The study of cell biology and membrane physiology. Topics include organization and functional properties of biological membranes, membrane physiology and signaling, rough endoplasmic reticulum and synthesis of membrane/secretory membrane proteins, endocytosis, the cytoskeleton, and cell division. The second of four modules in a yearlong foundational biology sequence; meets for the second half of the term. Prerequisite: BIOL 101.  SC ½ Course cr

BIOL 103a or b, Genetics and Development  Thomas Loreng and Staff
Foundation principles for the study of genetics and developmental biology. How genes control development and disease; Mendel’s rules; examples of organ physiology. The third of four modules in a yearlong foundational biology sequence; meets for the first half of the term. Prerequisites: BIOL 101 and 102.  SC ½ Course cr

BIOL 104a or b, Principles of Ecology and Evolutionary Biology  Thomas Loreng and Staff
The study of evolutionary biology, animal behavior, and the history of life. Evolutionary transitions and natural selection. Adaptation at genic, chromosomal, cellular, organismal, and supra-organismal levels. Distributional and social consequences of particular suites of organismal adaptations. The fourth of four modules in a yearlong foundational biology sequence; meets for the second half of the term. Prerequisites: BIOL 101, 102, and 103.  SC ½ Course cr
